Lab 1: Installing Jupyter Notebook and Diving into ggplot

Derek Hansen (Credit to Yanxin Jin; all errors are my own)

Lab 1 Overview

- 1. Organization
- 2. Icebreaker
- 3. Getting set up with R and Jupyter
- 4. Additional R and ggplot basics
- 5. Troubleshooting (if time permits)

Office Hours

Derek Hansen: M 9:00-10:30am
Yanxin Jin: Tu 8:30-10:00am

Jing Ouyang: Wed 12:00pm-1:30pmBrian Manzo: Th 9:00-10:30am

Contact

- Homework and lecture question: Piazza
 - All GSIs and Prof. Tan can answer
 - Option to be anonymous to other students (but GSIs and Prof. Tan will see your name)
- For other concerns related to the course: dereklh@umich.edu
 - Please put [STATS 306] in your heading

Lab

- About 1.5 hours (1:00pm 2:20pm)
- All notes from this Lab will be available on Github: https://github.com/dereklhansen/stats306_lab (https://github.com/dereklhansen/sta
 - Jupyter notebook files (".ipynb") and PDFS (".pdf") available
 - You can use Binder to view and run Jupyter notebooks on Github: https://mybinder.org/v2/gh/dereklhansen/stats306_lab/master (https://mybinder.org/v2/gh/dereklhansen/stats306_lab/master)
 - But you'll need to download them to your own machine to save your edits
- Recordings will be uploaded to Canvas
- 10 minute break halfway through (if lecture will take the entire time)
- Please keep your mic muted unless actively speaking
- No webcams required unless we are doing an interactive activity

Homework submission

• Write your homework in jupyter notebook and submit .ipynb file to the main course Canvas page (STATS 306 001)

Icebreaker

- Name?
- Major?
- Year?
- Fun fact (e.g. what motivated you to take this course?)

Getting set up with R and Jupyter

- I'm going to walk through an easy way to get up and running with R and Jupyter without the command line
- https://docs.anaconda.com/anaconda/navigator/tutorials/r-lang/ (https://docs.anaconda.com/anaconda/navigator/tutorials/r-lang/ (https://docs.anaconda.com/anaconda/navigator/tutorials/r-lang/ (https://docs.anaconda.com/anaconda/navigator/tutorials/r-lang/ (https://docs.anaconda.com/anaconda/navigator/tutorials/r-lang/ (https://docs.anaconda.com/anaconda/navigator (https://docs.anaconda.com/anaconda.com/anaconda.com/anaconda.com/anaconda.com/anaconda.com/anaconda.com/anaconda.com/anaconda.com

Additional R and ggplot basics

Here we'll demonstrate another dataset: the diamonds dataset.

```
In [6]: suppressMessages(library(tidyverse))
    head(diamonds)
```

R's built-in help

Just about everything in R is documented. Use the help function to open up a pop-up about the object in question.

```
In [8]: help(diamonds)
In [9]: ?diamonds
```

- Here the help for the diamonds dataset says: "A dataset containing the prices and other attributes of almost 54,000 diamonds".
- It also describes the variables in each of the columns.

Saving and loading R objects

- An important part of data analysis is saving your work so you can read it in later.
- The saveRDS function will save an object as a file
- The readRDS function will read a saved object from a file
- Use ".rds" or ".RDS" file extensions
- Note: "RDS" files can only be read by R!
- · By default, saves in the current directory

```
In [10]: saveRDS(diamonds, "diamonds.rds")
    diamonds2 <- readRDS("diamonds.rds")
    diamonds2</pre>
```

- More useful functions from the "readr" package (part of the tidyverse) are read_csv and write_csv
- These read and write "Comma Separated Value" files, which are text files that can be read as spreadsheets into programs such as Excel
- A lot of datasets come in CSV format
- Pretty much all data analysis programs support CSV (R, Python, SAS, Stata, Excel, etc)
- You can specify the variable type of each column, or R will guess automatically

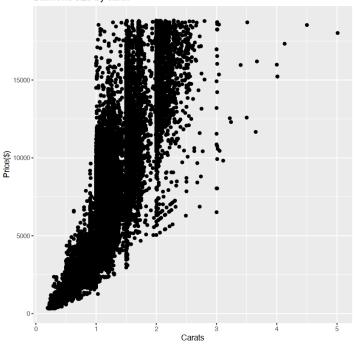

Many more file formats that R can read and write to:

- read_tsv, read_delim for text files with different text seperators
- haven package for reading to/from Stata, SAS, SDSS
- readxl package for reading to/from Excel
 - Generally better to just use CSV with Excel possible!

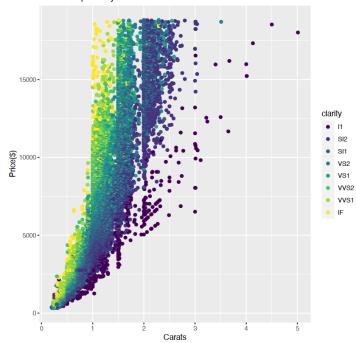

Creating the first plot

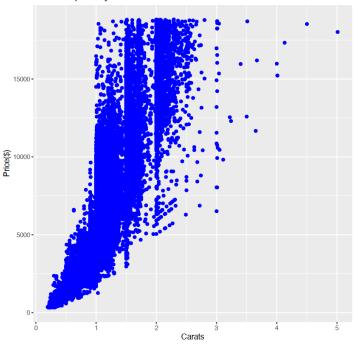

Diamond size by carat

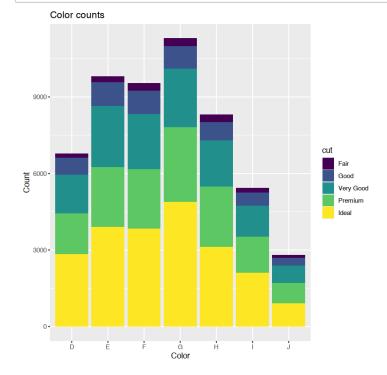

Diamond price by carat count

Diamond price by carat count

```
In [16]: ggplot(data = diamonds) +
    # geom_point(mapping = aes(x = carat, y = price, color = clarity)) +
    geom_bar(mapping = aes(x = color, fill = cut)) +
    labs(x = 'Color', y = 'Count') +
    ggtitle('Color counts')
```

Package documentation

```
?head
?tail
?geom_bar
```

You can always google the package documentations as well. For example, can you find the documentation page for rnorm?

Exercise

- 1. What is the default value of the mean and standard deviation used by the ``rnorm'' function in R to generate a value from a normal distribution?
- 2. Create a boxplot of `price' grouped by the levels in the `cut' variable. (see Jupyt er notebook for snippets for a hint)

Facets

If we want more segmented plots
